

*Some new approaches to the problem of optimal stopping*

**Ioannis Karatzas**

Department of Mathematics, Columbia University.

**ABSTRACT**

We review and compare two different approaches to the optimal stopping problem: the "pathwise approach" of Davis & Karatzas (1994), and the more recent approach of Bank & ElKaroui (2003) which proceeds via a representation result for optional processes. We present applications of both these approaches.
